Grizzly Bear Recovery Zones and Distributions

Introduction

Chapter I

Chapter II

Conclusion

History of Fragmentation

- Selkirk – completely isolated for multiple generations
- Cabinet – history of isolation and extremely low population size in 1980s-90s
- Yaak – no female movements

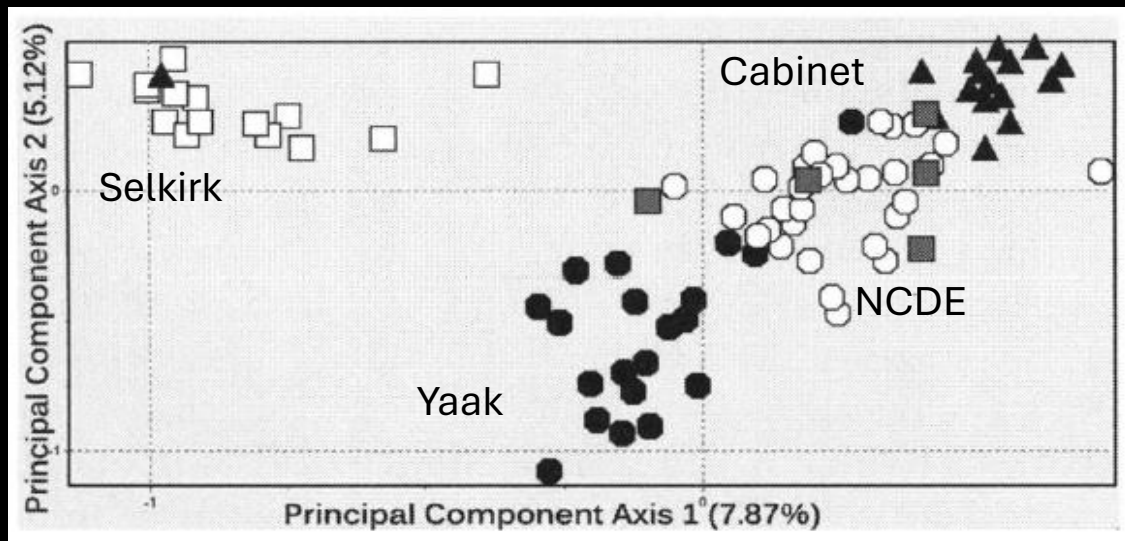

Genetic analysis reveals demographic fragmentation of grizzly bears yielding vulnerably small populations

Michael F. Proctor^{1,*}, Bruce N. McLellan², Curtis Strobeck³
and Robert M. R. Barclay¹

Effects of Fragmentation

- Selkirk: lowest genetic diversity in North America
- Cabinet population is inbred

Movements and Gene Flow

- Management actions
 - Conflict prevention
 - Land purchases
- Around 2006, movements and gene flow increased
 - Movement=migration
 - Reproduction=gene flow
- Gene flow in Selkirk and Yaak only

Cabinet Augmentation

22 bears translocated from NCDE since 1990

Need for Project

“Long-term survival of these small, threatened subpopulations will depend on successful management that reconnects them with a larger adjacent regional subpopulation” – Proctor et al. 2015

Chapter I Objectives

- i. Determine how migration and augmentation are affecting genetic diversity
- ii. Estimate effective population size

Dataset

21 microsatellite loci

Methods

Genetic diversity

Selkirk

Yaak

Cabinet

Methods

Genetic diversity

- Observed & expected heterozygosity: common diversity metrics
- Allelic richness: number of variants at a particular gene
- Pairwise relatedness: average genetic similarity between two individuals in a population
- Two-sided t-test

Methods

Effective population size

N: ecological processes

- Population growth
- Competition
- Density dependence

Methods

Effective population size

N_e : evolutionary processes

- Genetic drift
- Inbreeding

50/500 rule

Methods

Effective population size

Results

Effective population size

	Selkirk
Temporal	15.8
Linkage disequilibrium	15.2
N_e/N_c	0.15-0.16

Results

Effective population size

	Selkirk	Yaak
Temporal	15.8	17.5
Linkage disequilibrium	15.2	15.4
N_e/N_c	0.15-0.16	0.44-0.50

Results

Effective population size

	Selkirk	Yaak	Cabinet
Temporal	15.8	17.5	8.9
Linkage disequilibrium	15.2	15.4	5.6
N_e/N_c	0.15-0.16	0.44-0.50	0.19-0.31

50/500 rule

Synthesis

Chapter I

- Gene flow from migration and augmentation is maintaining or increasing genetic diversity
 - N_e/N_c ratios are comparable to other populations
 - GYE: 0.42-0.66
- BUT...
- Effective population sizes are small

Management Implications

- Management actions to improve connectivity are working
- Genetic diversity and effective population size baseline for future monitoring

Future Work

- Continued genetic monitoring
- Cabinet gene flow
- Genomic markers
