Exploring the exploitation of migratory moths by radio-marked grizzly bears in Wyoming

JUSTIN G. CLAPP, MARK A. HAROLDSON, JUSTIN A. DELLINGER, DANIEL D.
BJORNLIE, DANIEL J. THOMPSON, AND FRANK T. VAN MANEN

"These data are preliminary or provisional and are subject to revision. They are being provided to meet the need for timely best science. The data have not received final approval by the U.S. Geological Survey (USGS) and are provided on the condition that neither the USGS nor the U.S. Government shall be held liable for any damages resulting from the authorized or unauthorized use of the data."

Background

- Gunther et al. (2014) reported ≥ 266 species consumed by grizzlies in GYE
- Foraging on moths appears unique to central Rockies (Mattson et al. 1991, French et al. 1994)

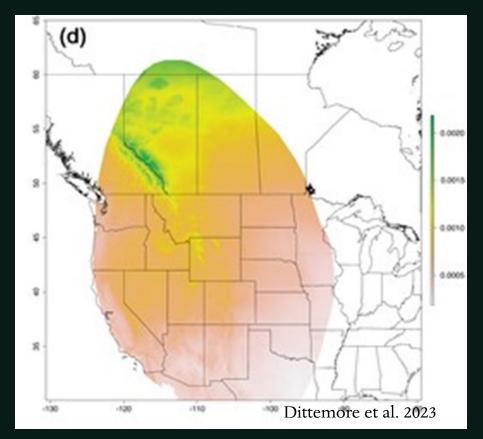

Background

- Dittemore et al. (2023) documented most moths originate from Great Plains
- Moths spend the day under loose rock/talus adjacent to alpine meadows
- Moths feed on nectar of alpine flowers at night

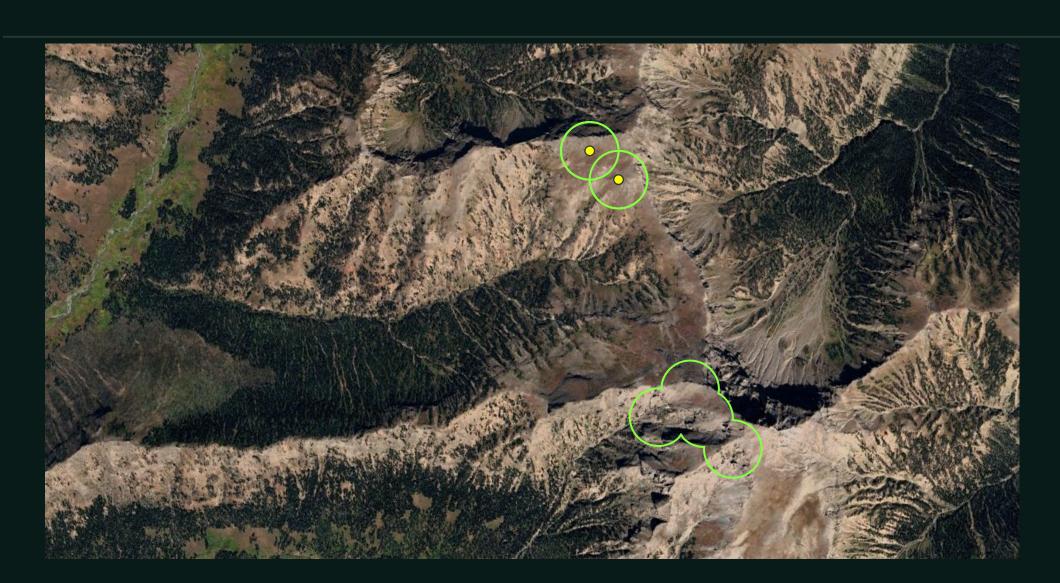

Background

- Moths are one of the most high-calorie foods available to bears (7.9 Kcal/gm;
 French et al. 1994)
- White et al. (1999) estimated that bears can consume up to 40,000 moths/day
- Increase in bear abundance and distribution has led to increase in use of this resource (~20-25% of population; Gould et al. 2024)

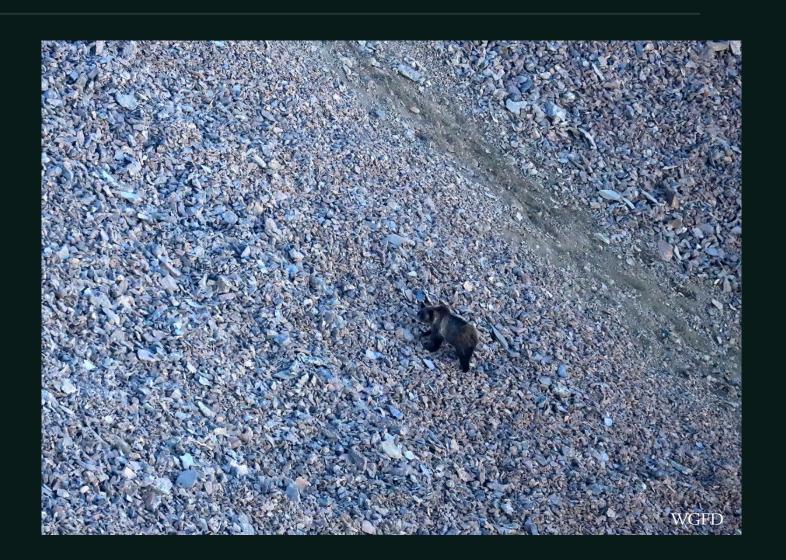

Moth Site Identification

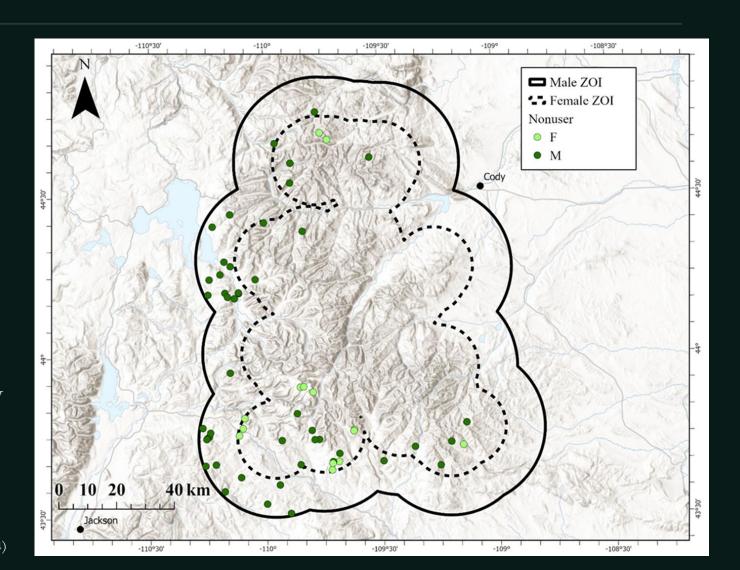

Derive "moth users" from monitoring data

- VHF → minimum 2 flight locations within moth polygon
- GPS → minimum 2 days where >= 50% locations within moth polygon
- GPS daily use → minimum 50% locations within moth polygon

Derive "non-moth users" from monitoring data

- Movement metrics of GPS
 collared bears used to establish
 availability
- Availability was 12.9 km (female) and 26.5 km (males)
- Applied availability to identify non-moth users
- Compared movement and activity data of GPS-collared moth users and non-moth users

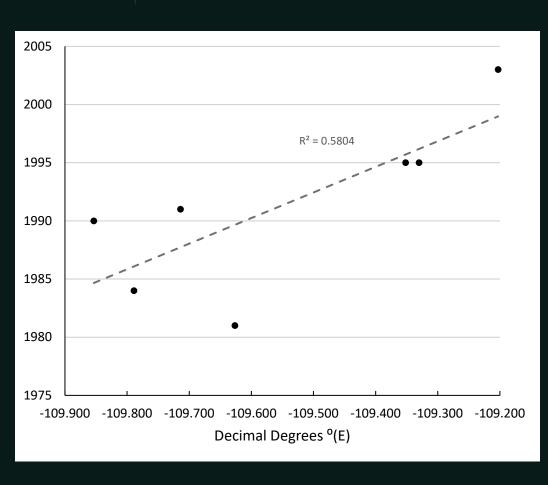

Results

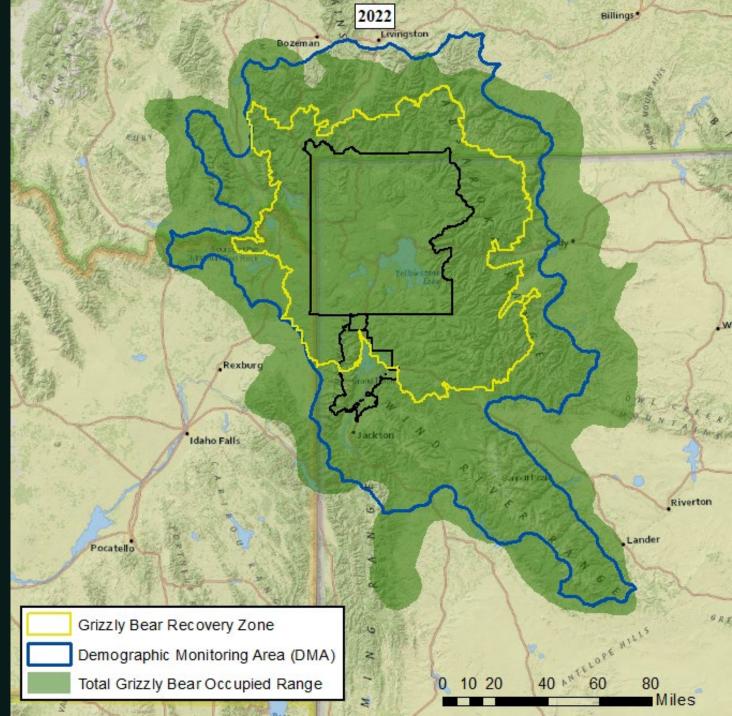

- 4,754 observations of bears on moth sites
- 36 distinct moth sites within 7 complexes
- Moth sites average >3,500 m in elevation, wide range in slope and aspect

Results

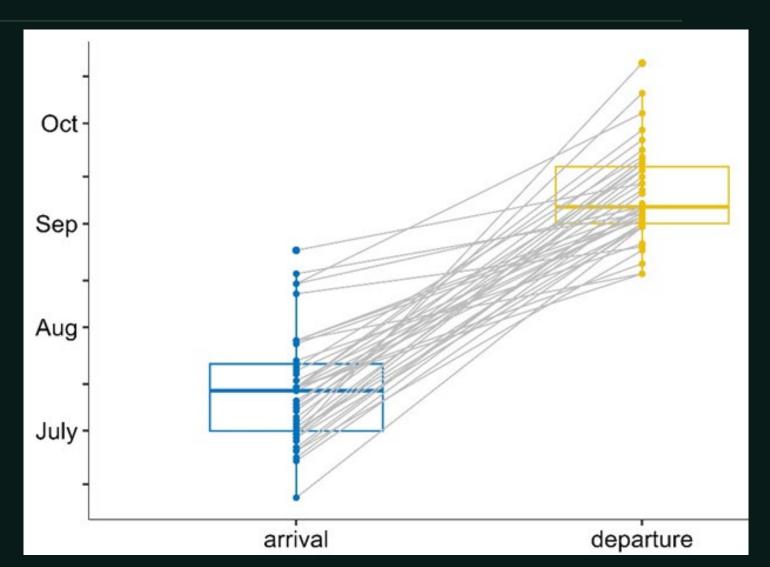

Results

- 47 VHF and 35 GPS bears → moth users
 (129 bear years)
- 81% used one site annually
- 31 bears used sites across multiple years (1.2 sites across seasons)
- 40 GPS bears → non-users (60 bear years)

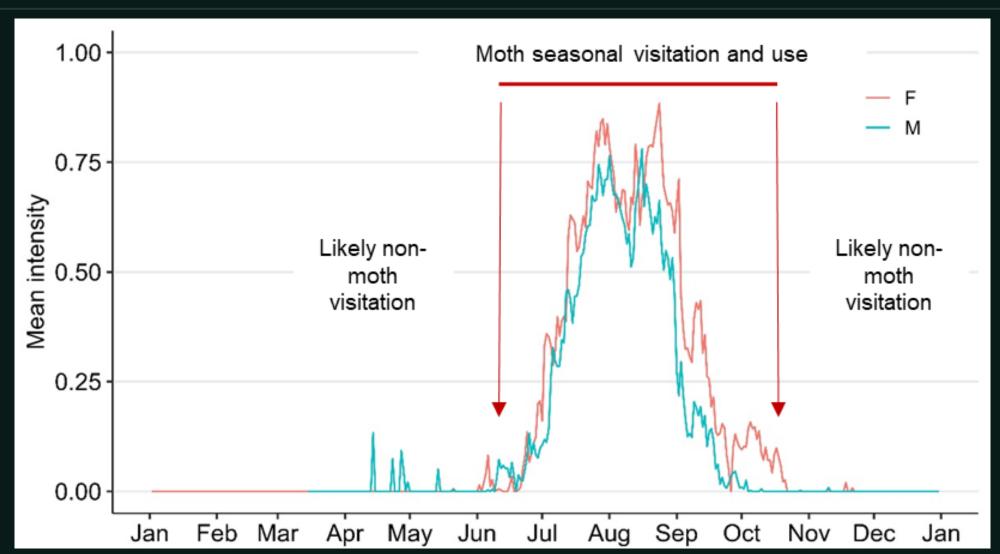

Arrival and Departure from Sites

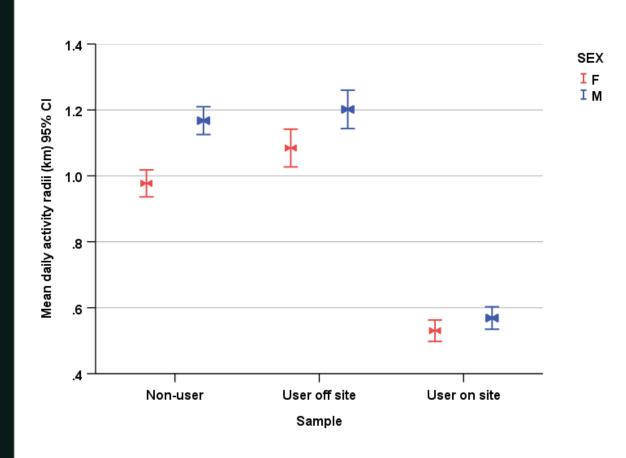

- 12 July 8 Sept.
- Females arrived ~ 1 week earlier than males
- Females stayed longer (67 days) than males (52 days)

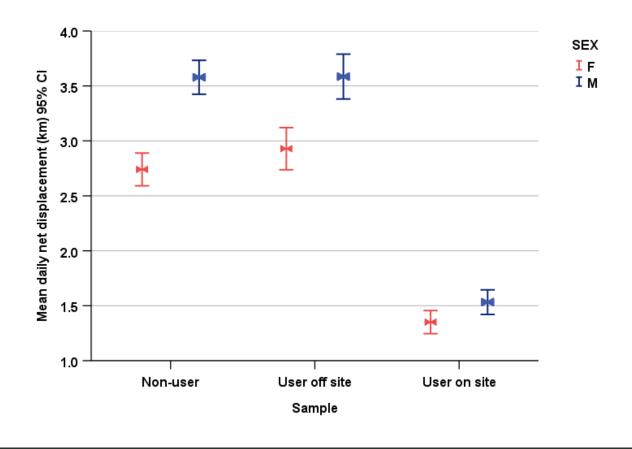

Intensity of Use and Seasonal Variation

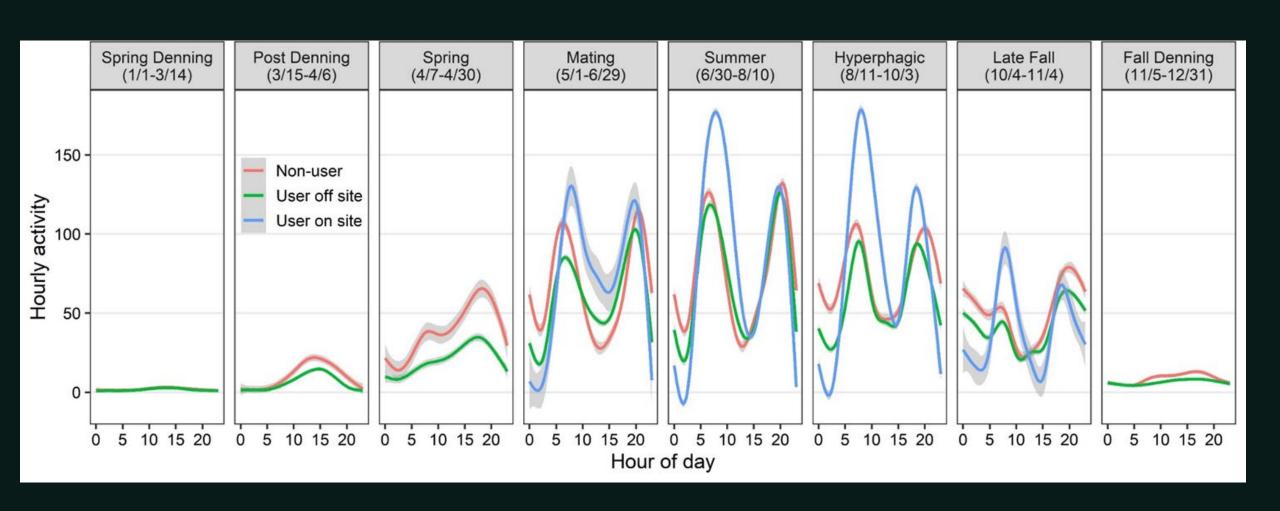

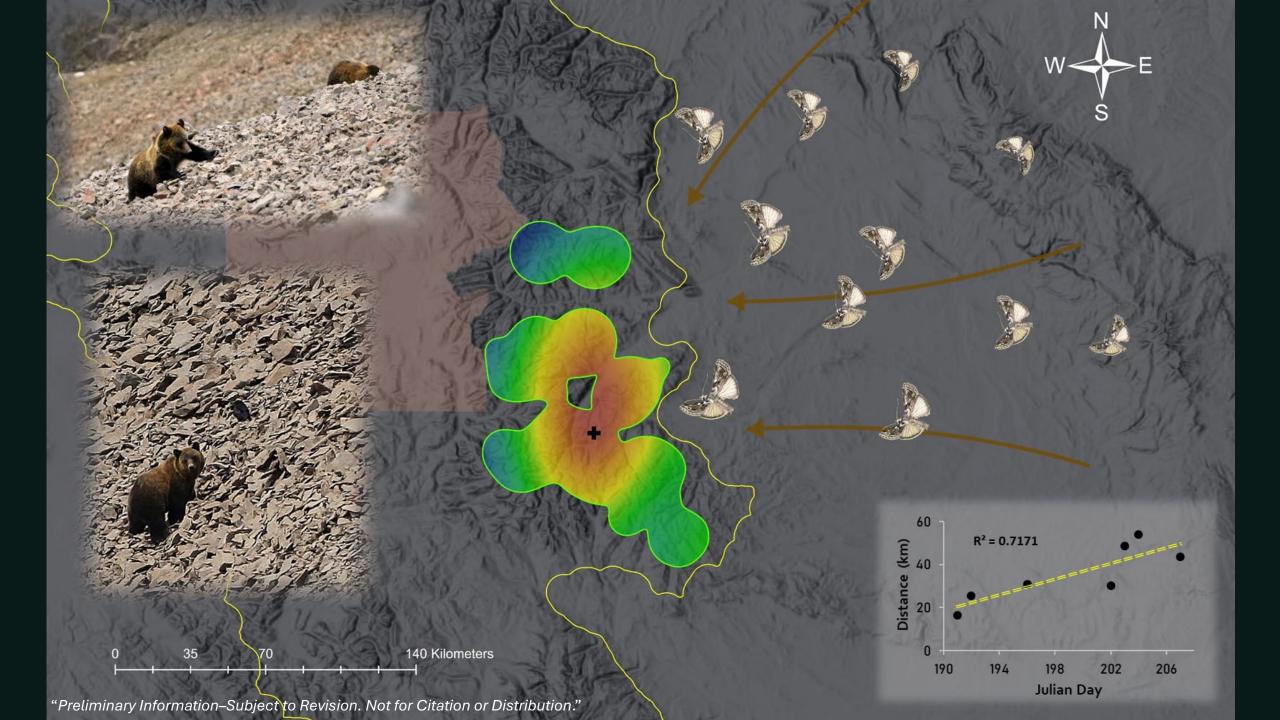

Variation in Movement Patterns

Variation in Activity by Season and Time of Day

Further Thought

- The ability to quantitatively assess use and exploitation of this food source is due to longterm monitoring and robust dataset spanning decades of collaborative interagency effort
- Human exploitation of this interaction between bears and moths is an ongoing challenge in reporting of results

Future Work

• Increase sample size

• Influence of moth use on demographics, energetics, and behavior

• Influence of human recreation on bears using moth sites
